IRAF spectroscopy documents

Use this to install IRAF

```
% whoami
iraf
%
 setenv iraf /iraf/iraf/
                                             # set root directory
 mkdir /iraf/iraf
8
                                             # unpack main IRAF distribution
8
 cd $iraf
 cat /d0/as.lnux.gen/as.* | zcat | tar -xpf
8
8
 cd /iraf
                                             # create BIN directories
8
% mkdir irafbin
% mkdir irafbin/bin.linux
% mkdir irafbin/noao.bin.linux
8
% cd $iraf/bin.linux
                                             # unpack core bin.linux
 cat /d0/ib.lnux.x86/ib.* | zcat | tar -xpf
8
 cd $iraf/noao/bin.linux
                                             # unpack NOAO bin.linux
  cat /d0/nb.lnux.x86/nb.* | zcat | tar -xpf
%
% cd $iraf/unix/hlib
                                             # run the INSTALL script
% source irafuser.csh
 ./install -n
8
% su
#
 ./install
#
 exit
%
% cd
                                             # read new .login
% source .login
                                             # pick up new iraf commands
% rehash
                                             # verify that the CL runs
% c1
```

Philosophy and practice of IRAF

IRAF may be big and difficult to learn in whole, but it has a very clear philosophy that is consistently implemented in all of its commands

IRAF is more than a software package just aimed to extract and calibrate astronomical CCD frames. Exploring in more detail, you will find that inside IRAF you have, for example, excellent plotting packages, a lot of tools for general astronomical computing, etc.

Some example tools

Under the package noao.astutil you have the tasks listed here

noao.astutil:	
airmass -	- Compute the airmass at a given elevation above the horizon
astcalc -	- Astronomical calculator
asthedit -	- Astronomical header editor
astradius -	- Find images within a circle on the sky
	- Compute UT, Julian day, epoch, and siderial time
ccdtime -	- Compute time, magnitude, and signal-to-noise for CCDs
galactic -	- Convert ra, dec to galactic coordinates
gratings -	- Compute and print grating parameters
keywpars -	- Translate the image header keywords used in ASTUTIL package
pdm –	 Find periods in light curves by Phase Dispersion Minimization
precess -	- Precess a list of astronomical coordinates
rvcorrect -	- Compute radial velocity corrections
setairmass -	- Compute effective airmass and middle UT for an exposure
setjd -	- Compute and set Julian dates in images

Commands, packages and tasks

- IRAF contains a large number of commands They are grouped in chunks called packages. For example onedspec package The packages are connected together in a tree-like structure Only a limited number of commands are available when
- IRAF starts. Others can be enabled by typing the name of
- the package they belong to
- Each package contains so called tasks . When you start
- a task you actually enter a subprogram, or even a specific

graphic environment

Commands, packages and tasks (cont.)

While you are executing a task you may enter commands in two ways:

Buy hitting single keyboard keys: for example qusually leaves the task and ? shows a list of available commands (!!! do not press ENTER !!!);

Buy entering double colon : followed by some more letters. For example: : order 5 ENTER (III finish by ENTER III)

Do not press keys randomly II IRAF recognizes abbreviations II

IRAF is an open software that allows you to write your own commands, tasks and packages. In your tasks you can include any IRAF command and task and even Fortran type code (check An Introductory User's Guide to IRAF Scripts)

Starting and leaving IRAF

- IRAF should be started from an xgterm window by typing cl The magic word to leave IRAF is logout In case of troubles Ctrl+C or Ctrl+Y but after that surely flprc To leave a package type bye To leave a task type q
- III Within a command or task do not press keystrokes randomly, not even the ENTER key or mouse buttons III

III To edit a command line do not use Backspace,

USC DELETE

Getting help

Getting help example

help noao shows a one-line description of each command in the package noao

|cl≻ help noao rootnoao.noao: artdata - Artificial data generation package [up] astrometry - Astrometry package astcat - Astronomical catalog and surveys access package [up] astutil - Astronomical utilities package [up] digiphot - Digital stellar photometry package [up] focas - Faint object classification and analysis package imred - Image reductions package [up] mtlocal - Magtape i/o for special NOAO format tapes [up] nobsolete - Obsolete tasks to be phased out in a future release [up] nproto - Prototype (temporary, contributed) tasks [up] observatory - Examine and define observatory parameters [up] obsutil - Observing utilities (planning or evaluation) [up] onedspec - One dimensional spectral red & analysis package [up] rv – Radial velocity analysis package [up] surfphot - Galaxy isophotal analysis package [up] twodspec - Two dimensional spectral red & analysis package

Remembering, finding ...

?→ to see the task names in the current package
??→ to see the task names in all open packages
help task-name → to see on top of the help screen in which package is the task
If you have no idea of the name of task you are looking for:

help * | match display references display

Operating system commands

Some linux system commands like 1s, pwd, cp, mv, etc., you can execute within IRAF (check login.cl):

cp file1 file2

To execute a command which IRAF do not "know"

use ! :

!lpr file-name

To execute a command as a background process: [!ximtool& or better [!ds9&]

Editing commands

To access the last command type E ENTER, then you can use the up-arrow key. You may edit the invoked command before execution

Use delete not backspace

ENTER key executes the command

The last command starting with hel is invoked by typing e hel

The command history shows a list of last typed commands. Command number 15 is repeated by typing ^ 15

history lists all the commands in the buffer

Task's parameters

Each IRAF task has its own set of required and hidden parameters that determine its execution. The values are stored in uparm directory. The required parameters should be supplied otherwise you will be asked for values.

You may change the values of parameters in two ways: temporary change: display image-name zrange=no zscale- z1=100 z2=300 permanent change: epar task-name

To list the parameters type lpar task-name
To return back to defaults use unlearn task-name

Task's parameters example

Executing epar setjd we can edit the parameters

eiven r			
			IRAF
PACKAGE	= one		tion and Analysis Facility
	= set	•	
mon	- 301	եյս	
images	=		Images
(observa	a=)observatory)	Observatory of observation
(date	=	date-obs)	Date of observation keyword
(time	=	ut)	Time of observation keyword
(exposu	r=		Exposure time keyword
(ra	=	•	Right ascension (hours) keyword
(dec	=		Declination (degrees) keyword
(epoch	=		Epoch (years) keyword
		•	
(jd	=	.jd)	Output Julian date keyword
(ĥ.jd	= = =		Output Helocentric Julian date keyword
(1.jd	=		Output local Julian date keyword
0			
(utdate	=	yes)	Is observation date UT?
(uttime	=		Is observation time UT?
(liston)	L=	· · · · · · · · · · · · · · · · · · ·	List only without modifying images?
(mode	=	(lp	
		4	

Calculator

IRAF has its own calculator. Simply type = 180/3.14159

to calculate how many degrees is one radian.

You can use parentheses, trigonometric functions and refer to variables. For example

= display.z2 - display.z1

gives the range of grey levels in displaying images with the display task.

IRAF set-up

Choose your IRAF starting directory, go there and execute the command mkiraf

toma@nrex:> mkiraf Initialize uparm? (yln): n Terminal types: xgterm,xterm,gterm,vt640,vt100,etc. Enter terminal type: xgterm A new LOGIN.CL file has been created in the current directory. You may wish to review and edit this file to change the defaults. toma@nrex:>

Then you can edit the login.cl file

LOGIN.CL -- User login file for the IRAF command language.

sethome= "/home/toma/data/work/"setimdir= "/iraf/imdirs/toma/"setuparm= "home\$uparm/"setuserid= "toma"

How to run IRAF

First, you must start a xgterm from a xterm by typing xgterm&

Switch to xgterm and cd to you IRAF starting directory where the file login.cl is. To start IRAF simply type

Another possibility is to put in your /usr/local/bin an executable script like this

cl

cd /home/toma/data/work/; xgterm -geometry +0+244 > -fn 10x20 -bg LightSteelBlue -fg black -dc -e cl &

IRAF image display set-up

XIMTOOL or DS9, this is the question ?

ximtool is the original IRAF image viewer but works with 256 color mode only (color depth 8). So, you must start X-windows with a command like this

startx -- -bpp 8

DS9 is the last generation of SAOimage and SAOtng viewers. Works in color deth 24 mode and interacts with IRAF in the same way as ximtool.

XIMTOOL screenshot

DS9 screenshot

Image display

Within IRAF start the image viewer you prefer with [ximtool & or [ds9 &]

To see different dimension images you can change the stdimage IRAF variable

reset stdimage=imt28 \rightarrow to see a 976x3040 pix image reset stdimage=imt4 \rightarrow to see a 1600x1600 pix image

The command gdevices lists all the available values for stdimage

Very useful tasks are imexamine and implot

IRAF format

IRAF has its own internal image format. Each FITS file is separated in two parts:

header → ASCII, extension .imh, contains log-book
 infos
pixel file → binary, extension .pix, stored in imdir

The last versions of IRAF can operate with FITS files. Sometimes it is very useful but not always

Check the package dataio typing help dataio to see the available commands for reading and writing files in IRAF.

Using lists of files

Almost any IRAF command accepts 3 sorts of input: single filenames, e.g. sp001.imh coma-separated sequences of filenames, e.g.

sp001.imh,sp002.imh,sp003.imh

lists, e.g. @list_a. The @-character tells IRAF to open file list_a.

To create file lists use the files command. For example: files a* > list_a

or files cat*.%fts%imh% > log.txt

Reading FITS files to IRAF format

The IRAF command is rfits. You can use it as follows:

rfits in name * out name \rightarrow for single file rfits (in list * (out list) \rightarrow for in and out file lists rfits ($din list * c \rightarrow output in files c0001)$ c0002 rfits $Qin list * '' old \rightarrow restore the original$ file names rfits Q in list make im- \rightarrow only to check the content of a magnetic type or DAT

Writing IRAF files in FITS format

The IRAF command is wfits. You can use it as follows:

wfits in name out name \rightarrow for single file wfits @list1 @list2 \rightarrow for file lists wfits fy*.imh mttk1 \rightarrow to write onto a DAT

> How to change the filenames for a list of files ?

Deleting and setting bits appropriately

You can remove normal files in two ways using delete log*.lst or [rm log*.lst

Images you can remove using the command imdelete only!!! For example imdelete a*.imh will delete both the a.imh and a.pix files.

It may happen that your images look to be composed of pixels with negative counts. This is generally a reading/writing software problem.

For example, if in your image the counts range from -32768 to +32768 you can restore the original 0 to 65536 scale using

imarith @list a + 32768 @list b calctype=real pixtype=real

Printing text, graphics or image

Text can be printed directly lprint file-name or with redirection help astutil | lprint

<u>Line graphics</u> can be copied to a printer by pressing the = key. The same screens can be also saved to a postscript file by typing :.snap epsfl ENTER

For <u>halftone graphics</u> use ximtool or DS9. See for help the corresponding File menu
